Generation of live bimiravirus from synthetic RNA transcripts - useful for vaccines against infectious bursal disease

Patent Assignee: UNIV MARYLAND BIOTECHNOLOGY INST (UYMA-N)

Inventor: MUNDT E; VAKHARIA V N

Number of Countries: 078 Number of Patents: 002

Patent Family:

Patent No	Kind	Date	Week
WO 9809646	A1	19980312	199817 B
AU 9738918	A	19980326	199832

Local Applications (No Type Date): WO 97US12955 A 19970731; AU 9738918 A

19970731

Priority Applications (No Type Date): US 96708541 A 19960905

Abstract (Basic): WO 9809646 A

A novel method for preparing a live Bimiravirus, comprises: (a) preparing a cDNA containing infectious bursal disease virus (IBDV) genome segments A and B; (b) transcribing the cDNA to produce synthetic RNA transcripts; (c) transfecting host cells with the synthetic RNA transcripts; (d) incubating the host cells in a culture medium; and (e) isolating live IBDV from the culture medium. Also claimed are: (1) a

live IBDV produced by a method as above; (2) a synthetic RNA encoding protein VP1-VP5 of IBDV; (3) a cDNA containing at least a portion of IBDV genome chosen from segment A, B or A and B of IBDV, where the cDNA includes the 5' and 3' termini of the segments; (4) a recombinant vector comprising the cDNA as in (3); and (5) a host cell transfected with the synthetic RNA of (2) or vector of (4).

USE - The live IBDV, which is inactivated or attenuated prior to administration, is used in a vaccine. The vaccine is useful for protection against IBD (or Gumboro disease) which is characterised by the destruction of lymphoid follicles in the bursa of Fabricius. In a fully susceptible chicken flock of 3-6 weeks of age the clinical disease causes severe immunosuppression, and is responsible for losses due to impaired growth, decreased feed efficiency and death.
